
daylio-parser

Release 0.1.0

Meesha

Apr 11, 2021

CONTENTS:

1	Installation	1
2	Config	3
3	Parser	5
4	PlotData	7
	Index	9

INSTALLATION

Via pip:

```
pip3 install --user daylio-parser
```

Via Pipenv:

```
pipenv install daylio-parser
```

Via Poetry:

```
poetry add daylio-parser
```

CONFIG

daylio-parser comes with a default config that works for the default Daylio setup after installing the app. That is, there's just 5 moods, called *awful*, *bad*, *meh*, *good*, *rad*.

Each mood has its class:

class Mood

name: **str**

Name of the mood, must correspond with mood name in the exported CSV.

level: **int**

Assigned numeral level for the mood (higher = better mood).

color: **str**

Any hex color.

boundaries: **Tuple[float, float]**

A tuple with lower and upper bound for the mood. Any average mood that falls within these boundaries will be colored using the *Mood.color*.

The whole mood config for your app will be constructed using the *MoodConfig* class.

class MoodConfig (*mood_list=None*)

Creates a config with *mood_list*. If the mood list isn't provided, *DEFAULT_MOODS* will be used. All moods are automatically numbered (levels are assigned) and boundaries are also calculated. Each boundary is exactly 1 in size, with the first one and the last one being only 0.5 in size.

Parameters *mood_list* (*List[Tuple[str, str]]*) – A list of moods with (name, color)

from_list (*mood_list*) → None

Updates the config with a new list of moods.

Parameters *mood_list* (*List[Tuple[str, str]]*) – A list of moods with (name, color)

get (*mood_name*) → *Mood*

Returns a *Mood* by its name.

Parameters *mood_name* (*str*) – Mood name

PARSER

class Entry

A class that holds data for an entry in the diary. One day can have multiple entries.

datetime: `datetime.datetime`

mood: `Mood`

activities: `List[str]`

notes: `str`

class Parser (*config=None*)

Parser for the CSV file. If config is not provided, a default one will be created.

Parameters **config** (`MoodConfig`) – MoodConfig for the parser

load_csv (*path*) → `List[Entry]`

Load entries from a CSV file.

Parameters **path** (*str*) – Path to the CSV file

load_from_buffer (*f*) → `List[Entry]`

Actually reads the entries from a CSV file.

Parameters **f** – A file-like object

PLOTDATA

class PlotData (*entries*, *config=None*)

A class that provides some data for easier plotting.

Parameters

- **entries** (*List [Entry]*) – A list of parsed entries
- **config** (*MoodConfig*) – MoodConfig for the parser (if none is provided, a default one will be created)

split_into_bands (*moods*)

Splits input moods into bands, given their boundaries. See [Mood.boundaries](#).

interpolate (*avg_moods=None*, *interpolate_steps=360*)

Interpolates moods to make a smooth chart.

Parameters

- **avg_moods** – Average moods to iterate over. If not provided, these are generated by `Stats.average_moods()`
- **interpolate_steps** (*int*) – Number of steps for one day (midnight to midnight)

INDEX

A

activities (*Entry attribute*), 5

B

boundaries (*Mood attribute*), 3

C

color (*Mood attribute*), 3

D

datetime (*Entry attribute*), 5

E

Entry (*built-in class*), 5

F

from_list() (*MoodConfig method*), 3

G

get() (*MoodConfig method*), 3

I

interpolate() (*PlotData method*), 7

L

level (*Mood attribute*), 3

load_csv() (*Parser method*), 5

load_from_buffer() (*Parser method*), 5

M

Mood (*built-in class*), 3

mood (*Entry attribute*), 5

MoodConfig (*built-in class*), 3

N

name (*Mood attribute*), 3

notes (*Entry attribute*), 5

P

Parser (*built-in class*), 5

PlotData (*built-in class*), 7

S

split_into_bands() (*PlotData method*), 7
